Quick valuation

When?

A one-time market picture of a selected or manually entered vehicle.

Starting a valuation: three ways

- **Photo:** upload a vehicle photo, and CarVinsight will provide a recommendation for the make, model, year and colour. Check and confirm the recommendation, then start the quick valuation.
- **Vehicle registration certificate:** upload or take a photo of the vehicle registration certificate. Check the extracted data, then start the valuation.
- **Classic:** manually enter the make, model, year and other known fields.

Further details: Vehicle identification from a photo and valuation entry points.

Input (after the chosen entry path)

Fields that can be checked and completed: make, model, year, body type, mileage, fuel, engine capacity, transmission, first registration, region and market environment.

Result

- realistic vehicle value
- market sample summary (quantity, ranges, informative median value)
- list of understandable correction factors (for example mileage, equipment, regional difference, according to the displayed items)
- decision support indicator
- CV code

When rerun for the same vehicle, the system may provide the same code (overwrite and short history) so that parallel identifiers do not multiply. Every successful valuation has a unique CV code, with which the result can be recalled later.

Support: Telegram and Viber, 24 hours a day, every day of the week.
