Where the decision picture comes from

CarVinsight builds information packages from European vehicle and market information, current market observations, and patterns generated during searches. It links the information together: type, equipment, market situation, and the vehicle's own data sheet converge into the same decision picture.

This is the 'master book' of CarVinsight: it does not replace the dealer, but organises and makes visible the elements from which the next decision can be prepared.

The scope of information is constantly expanding, so you get a more complete picture with every search.

Hungarian market data (updated: 13 November 2026)

The Hungarian market window and the decision picture show the market data of October 2026: average advertised price 5 410 000 Ft, 128 930 advertisements. The sales chance per vehicle is prepared using the same method based on market data, which is always advisory in nature (Recommendation, not mandatory).

Confirmation (2026-11-09): the Hungarian market window is available to every dealer.

Market signals from the CV agent (13 November 2026)

The market signal of the CV agent is also part of the decision picture, in the Search, at the Valuation, and in the stock, for every dealer. The signals are generated from CarVinsight's own market database, and they only appear if they are supported by at least 20 comparable advertisements, and the change is significant.

- **Brand-level change:** the annual development of the brand's advertised supply and asking price.
- **Type-level saleability:** the typical time spent on the market and the disappearance rate (sale or withdrawal) of the advertisements for the given type.
- **Supply and demand:** the change in the advertised supply of the type compared to the previous period.
- **The situation of the vehicle:** the position of the mileage and the asking price among comparable advertisements of a similar year of manufacture.

The signals provide an explanation, they do not modify the calculated prices and the sales chance. If there is little data, the CV agent does not state anything.
